

Week 3 · Curate Your Images

Muhrram Ali · AI Fluency

1. Images the portfolio actually needs

Matched to the content map from the previous deliverable.

- Home strongest case → Cosmic.Ai pipeline/dashboard — **real screenshot**
- Supporting case → YOLO detection result — **real output**
- Supporting case → Task API Swagger UI — **real screenshot**
- Work Case 3 → Postgres + docker compose persistence — **real capture**
- Work Case 4 → Discord message published by Social Media Studio — **real post**
- Brand → MA logo / favicon — generated once then locked
- About → Photo of me — **real photo only**

2. Final image set (the keepers)

Real captures (the work itself)

1. Cosmic.Ai – clean, cropped pipeline or dashboard screenshot
2. YOLO – detection result with visible boxes and scores
3. Task API – Swagger UI showing the CRUD endpoints
4. Postgres stack – proof that data survives container restart
5. Social Media Studio – actual Discord message the system published

Generated (connective tissue only)

6. MA logo / favicon – Inter Bold, white on #2B6CB0, rounded square
7. Optional quiet geometric divider or texture in the same palette (used sparingly)

Person

8. Real photograph of me. No AI face.

3. Where I chose real capture over AI

Every piece of actual work (pipelines, detection results, API docs, Discord posts, Docker persistence) is shown with a real screenshot or real output. AI is never used as a stand-in for the work itself. AI is only used for the small brand mark and, if needed, one quiet connective texture that matches the identity kit. This follows the portfolio rule: the design frames the work; the work stays the most memorable visual element.

4. Rejection note (discernment)

I generated several “AI pipeline / neural-net hero” images and abstract glowing-node backgrounds. They all shared the current AI-slop look: soft glass, over-saturated blues, floating nodes, and a generic tech-fantasy mood. If I had used any of them as a hero or section background they would have become the most colorful and memorable thing on the page — exactly the opposite of the goal. A recruiter should remember the real YOLO trade-off or the fact that the same API survived a database swap, not a generated illustration of “AI”. I rejected the entire set. A quiet heading over whitespace, plus the real screenshots listed above, is stronger, more honest, and more consistent with the identity kit (calm, technical, confident).

Summary: Work → always real captures. Brand mark → one locked generation. Decorative hero / abstract tech art → fully rejected. Photo of me → real photo only.
